BIOS 7001 Biochemistry

COURSE DESCRIPTION: This is an introduction to fundamental topics in biochemistry and physical biochemistry. Topics include: protein structure, folding, and function, nucleic acid structure and protein-DNA interactions, enzymology, energetics & allostery, posttranslational modification of protein function, transcription, translation, and DNA replication. The material is presented in formal lectures in conjunction with a protein/nucleic acid structure-based tutorial.

COURSE OBJECTIVES: The goal of this course is to educate students on the fundamentals of biochemistry including protein and nucleic acid structure, enzymology, and DNA replication, transcription, and translation. In addition, students will learn how to interpret and manipulate protein and nucleic acid structures.

PREREQUISITES: One semester of undergraduate biochemistry and a course in organic chemistry are required. Undergraduate physical chemistry is also helpful preparation. Students who are uncertain about the adequacy of their undergraduate training for this course should discuss the issue with their advisory committee and then consult the course leader. Students should be familiar with the general principles of biochemistry including basic knowledge of amino acid and nucleic acid structure. They should also be familiar with general principles such as DNA replication, transcription and translation. All students who want to register for Graduate Biochemistry must complete the assessment exam during Orientation Week.

SUITABLE FOR 1ST YEAR STUDENTS: Yes

STUDENT ASSESSMENTS: There are three closed-book exams (2 hours each) administered throughout the Block worth 30% each. In addition, 10% of the grade will be based on tutorials for nucleic acid/protein structure.

CREDIT HOURS: 5.0
CLRM 5820 Epidemiologic Research Methods

COURSE DESCRIPTION: This course focuses on the analytical issues of epidemiological studies: biases, confounding, interaction, and statistical methods used in case-control and longitudinal studies. In-class exercises will reinforce these concepts. Students are expected to know the basic design issues of retrospective and prospective studies as well as clinical trials from the Clinical Research Intensive course.

PREREQUISITES: Clinical Research Intensive

STUDENT PREPARATION: Students are expected to know the basic design issues of retrospective and prospective studies as well as clinical trials from the Clinical Research Intensive course.

SUITABLE FOR 1ST YEAR STUDENTS: No

STUDENT ASSESSMENTS: In-class exercises/class participation 50%, Mid-term test 25%, Final Exam 25%

(CLOSED REGISTRATION) LIMITED TO 15 STUDENTS NEED APPROVAL FROM PROGRAM DIRECTOR-DR. AILEEN MCGINN (PICK UP COURSE REGISTRATION FORM IN THE GRADUATE OFFICE)

CREDIT HOURS: 3.0
BIOS 7006 Molecular Genetics

COURSE DESCRIPTION: The course is designed to convey genetic concepts and their application in a diverse set of model systems. It will allow students to understand and critically evaluate the literature. The course is divided into three sections. In the first section, students will briefly review basic genetic concepts. This part is followed by a discussion of yeast and bacteria as genetic models and their use in high throughput and classical biochemical approaches. In the second section, students will learn about the major vertebrate systems, including human genetics, mouse genetics, and zebra fish genetics. The third section is dedicated to invertebrate genetics (including worms and flies) as well as to a discussion of special aspects of cancer genetics. Overall, this course should convey graduate level genetics in all its modern facets and constitute the foundation for more advanced studies.

COURSE OBJECTIVES: A comprehensive syllabus includes a brief introduction and an overview of all major model organisms currently in use for research. The goal of this course is to provide an overview over modern genetic methods and approaches using both classic and modern examples and to convey the possibilities and contributions of the field of Genetics to the understanding of biological processes.

REQUIRED MATERIALS: Computer

PREREQUISITES: Undergraduate genetics is required

SUITABLE FOR 1ST YEAR STUDENTS: Yes

STUDENT ASSESSMENTS: Passing grade is usually 60%. There are exams after each section of the course. The first and second exam count for 30% each and the third exam for 40%.

CREDIT HOURS: 5.0
CLRM 5860 Multivariable Regression

COURSE DESCRIPTION: Multivariable Regression builds on the knowledge of univariate and bivariate analyses that were learned in the Clinical Research Intensive course and introduces concepts related to multivariable model building for multiple linear regression, logistic regression and survival analysis. Both the lecture and the lab will focus on multiple regression model building, interpretation and diagnostic tests, assessing for interaction, and statistical adjustment for confounding.

COURSE OBJECTIVES:
- To learn the basics and applications of multivariable regression in assessing associations between exposure/explanatory variables and various forms of outcome variables.
- To use Stata software to conduct multivariable regression and be able to interpret results from the application of these modeling techniques.

REQUIRED MATERIALS:
  NOTE: this textbook is available online via the Einstein Library as a pdf

PREREQUISITES: Clinical Research Intensive; Students are expected to know the material covered in Clinical Research Intensive, including univariate and bivariate statistical analyses and basic epidemiological study designs.

SUITABLE FOR 1ST YEAR STUDENTS: No

STUDENT ASSESSMENTS: Class Participation 10%, Homework 30%, In-class quizzes 15%, Take home exams 45%

(CLOSED REGISTRATION) LIMITED TO 20 STUDENTS NEED APPROVAL FROM PROGRAM DIRECTOR-DR. AILEEN MCGINN (PICK UP COURSE REGISTRATION FORM IN THE GRADUATE OFFICE)

CREDIT HOURS: 5.5
BIOS 7406 Principles of Neuroscience I

COURSE DESCRIPTION: Principles of Neuroscience I is a highly-interactive 13-week course required for students in the Department of Neuroscience. The course offers a multidisciplinary approach to the study of the nervous system from first principles with a focus on the molecular and cellular basis of brain function. Topics include fundamental principles underlying neuronal excitability, mechanisms of electrical and synaptic neurotransmission, the cells of the brain and their role in neurotransmission, and the architecture of the central nervous system. The class format consists of a combination of formal and informal lectures and student presentations with a major emphasis on interactive class discussion. The course requires active student participation during the class and offers review sessions if needed. This course makes significant use of the Canvas online discussion forum, where assignments are often given to expand on topics covered in class. In addition to normal course scheduled lectures, the course includes lab visits and students are also required to prepare and present at a symposium on a specific topic and to attend the weekly Neuroscience Seminar Series.

COURSE OBJECTIVES:
1. Understand the chemical and electrical principles that lead to neuronal excitability
2. Understand the principles that underlie neurotransmission, and understand how non-neuronal cells support this process
3. Understand the molecular and cellular mechanisms that give rise to neurotransmission, and how input leads to short and long-term changes in neuronal function

PREREQUISITES: None

SUITABLE FOR 1ST YEAR STUDENTS: Yes

STUDENT ASSESSMENTS: Attendance and class participation, 25%; presentations 25%; final exam 50%. To pass the course the Final exam must be passed, however this is not sufficient. Active participation in class and well-prepared presentations will be assessed and considered for passing.

CREDIT HOURS: 6.0
BIOS 7010A – Quantitative Skills for the Biomedical Researcher I

COURSE DESCRIPTION: Topics covered will include introduction to probability, discrete and continuous probability models, sampling distributions, the central limit theorem, confidence intervals, and hypothesis testing. While computing is not one of the main learning outcomes, the students will be briefly introduced to the statistical programming language R.

COURSE OBJECTIVES: This 3-week course aims to acquaint students with the fundamental concepts of biostatistics, applications of basic methods, and their interpretation.

REQUIRED MATERIALS: No Textbook Required; Computer with R freeware installed.

REQUIRED MATERIALS: Statistical Software: You will use the statistical software R. The core learning outcomes of the course are conceptual and are not related to the software. You are not going to need the software for the exam.

Recommended Textbooks: These books are not necessary for the course but they may be helpful resources for your research.

PREREQUISITES / STUDENT PREPARATION: All students are expected to have basic computer skills and college mathematics. Although not required, we highly recommend those without R experience to attend Beginning R workshop (2 sessions, each 1.5 hours) the week before QSBR 1.

SUITABLE FOR 1ST YEAR STUDENTS: Not recommended; permission from course leader required if seeking to take this course in the first year.

STUDENT ASSESSMENTS: Course grade will be based on homework (20%), and an exam (80%).

CREDIT HOURS: 1.0
BIOS 7010B – Quantitative Skills for the Biomedical Researcher II

COURSE DESCRIPTION: In QSBR I, the focus is on the basic concepts of statistical inference, especially the idea of quantifying the uncertainty of estimation and reasoning of hypothesis testing. In QSBR II, we will apply the basic concepts of statistical inference to explore relations between two or more variables, and the focus of the teaching will shift from basic concepts towards the art of data analysis. Below are a few things that might help you do well in learning statistics.

The best way to learn statistics is to apply your own common sense and reasoning, and applying statistical methods to real problems encountered in your research.

Although math plays an important role in statistics, for the vast majority of biomedical researchers, it is more important to understand what a particular statistical method tries to do than to know the details of the mathematical formula and computational algorithms. In other words, you want to have the big pictures before getting into the details. Mathematics mostly serves the purpose of justifying our common sense and enabling us to handle complicated problems.

For data analysis, it is often much more important to make sense of the data using a variety of visualization tools before describing them with numbers and statistical models.

We will also use software R in this module. It is used mainly for
1. visualizing the data
2. numerical simulation to help understand statistical methods
3. perform some modern statistical computational methods.

Topics to be covered:
Fisher Exact Test and Hypothesis Testing
Chi-square Tests + R session
Correlation and Linear Regression
Regression Diagnostics
One-Way ANOVA + R session
Two-Way ANOVA and Statistical Interactions
Permutation tests (Bring your laptops to the classroom)
Logistic Regression + Extra R session
(Possibly) Repeated Measure and Random Effect Model

COURSE OBJECTIVES: Build your confidence in understanding and using at least some statistical methods that are not taught in this course when you need them in your future research.

RECOMMENDED MATERIALS:

PREREQUISITES: Quantitative Skills for the Biomedical Researcher I or equivalent.
GRADUATE PROGRAMS IN THE BIOMEDICAL SCIENCES

SUITABLE FOR 1ST YEAR STUDENTS: Not recommended; permission from course leader required if seeking to take this course in the first year.

STUDENT ASSESSMENTS: 50% HW and 50% on Final Exam

CREDIT HOURS: 1.0
BIOS 7010C – Quantitative Skills for the Biomedical Researcher III

COURSE DESCRIPTION: This course will cover the statistical principles that are pertinent to the study of big-omic data sets being collected in biology. Students will learn about current statistical approaches, issues related to experimental design and reproducible research, and important case studies that illuminate some of the challenges of analyzing big data. This course is the third module of the Quantitative Skills for the Biomedical Researcher series, and builds upon the material covered in the first two modules. As part of the assessment, students will gain practical experience by conducting a mini big data research project while working in small teams.

COURSE OBJECTIVES: Students will be taught practical skills to conduct big data analysis and understand the challenges/limitations of this field.

PREREQUISITES: It is expected that students will have completed Quantitative Skills for the Biomedical Researcher I and II, or have acquired this material through other means (please consult the course leader if in doubt). Programming skills in R is mandatory. All students are expected to have a working knowledge of basic computers and college mathematics.

SUITABLE FOR 1ST YEAR STUDENTS: Not recommended; permission from course leader required if seeking to take this course in the first year.

STUDENT ASSESSMENTS: Final project (100%).

CREDIT HOURS: 1.0
BIOS 7020A Responsible Conduct of Research – Advanced

COURSE DESCRIPTION: The National Institutes of Health (NIH) requires that all pre-doctoral and post-doctoral trainees receive training in the responsible conduct of research at a frequency of no less than every four years. This advanced course in the responsible conduct of research is for the more experienced (5th year) graduate students and postdocs. (All pre-doctoral and post-doctoral trainees are required to take the first instance of the RCR course in year one of training.)

This advanced course will cover the following topics:

- Overview of RCR and Policies
- Data Management Practices and Problems
- Mentor and Trainee Responsibilities and Relationship Issues
- Authorship and Publication – Balancing Expectations and Realities; Strategies for Success

This is a four-week course. The first session will be a general overview and review of institutional, professional and national policies. The other three sessions will include a 40-45 minute-lecture followed by small breakout group sessions (1 hour) to review scenarios and problem-based case studies.

This course fulfills an NIH retraining in RCR requirement and is required for PhD students and post-doctoral fellows in the 5th year of training.

REQUIRED MATERIALS: Course readings will be distributed or made available as pdf files.

PREREQUISITES: 1st year Responsible Conduct of Research

SUITABLE FOR 1ST YEAR STUDENTS: No

STUDENT ASSESSMENTS: To satisfy this advanced course, attendance at every session (lecture and breakout) is required. Missing a session (due to illness or professional travel) will require the submission of a make-up assignment in order to satisfactory complete the course.

CREDIT HOURS: N/A
